

For Immediate Release

New Privacy for Social Networks

Sacramento, CA, November 12, 2006 – Rantiq (www.rantiq.com), an all-in-one social networking solution, wants to give you control over the privacy of your online profile. Instead of an all on or all off solution, Rantiq lets users control the privacy of up to 15 profile sections for every single friend.

As more users participate in social networking, the concern over privacy continues to increase. By joining networks such as Myspace or Friendster, you will have access to millions of other people's personal information.

Rantiq developed privacy controls allowing users to hide or show up to 15 sections of their profile. Users can apply these settings to each friend by creating a privacy group. When friends are put into these groups they can only see what their friend wants them to see.

"A trend in social networking is to invite as many people as possible even if they are complete strangers," said Rantiq's Founder and CEO Enoch Lee. "As a result, anyone in a user's friends list will have access to that user's profile, even if that information is personal."

"At Rantiq we want to give users more options instead of an on or off solution," he continues. "We believe that as people make more online friends, they will want more control over the privacy of their profile. Giving users more control over their privacy will help protect personal information in our social network."
